

SEQUENCED BUILD ROADMAP

Duravel — Garmin + iOS, one plan

The Garmin import and the iOS App Store app merged into a single sequence. The insight that drives the order: **Garmin and iOS HealthKit feed the same model**, so the shared ingestion pipeline is built **once, first**, and both plug into it. Meanwhile two external approval clocks — Garmin and Apple — start on day one because they gate everything and involve zero code.

Weeks are relative and assume part-time effort. W0 = today. External approvals are variable — the dashed bars are "waiting," not "working."

⚡ **Start today (no code, long lead):** (1) submit the **Garmin Connect Developer Program** application (Activity + Health API); (2) confirm your **D-U-N-S** and begin **Apple Developer org enrollment**. Nothing on the Garmin or iOS lanes can finish until these clear, so firing them now is the single highest-value move.

GROWTH LOOP

Strava activity-write branding

Result cards → web session/race flows

Cards → iOS share sheet

Critical path & dependencies

Two chains run in parallel. The **iOS chain is the long pole** (Apple enrollment → Capacitor → HealthKit → compliance → review). The Garmin chain runs alongside it and finishes sooner.

Dependency chain

- **APPR** Garmin approval → **gates** all Garmin coding
- **APPR** D-U-N-S → Apple org enrollment → **gates** all iOS work
- **FND** Shared pipeline → **gates** Garmin ingest *and* iOS HealthKit
- **GAR** + **iOS** both feed the same **readiness/adherence** model

Milestones

- **M1 · ~W5** — Shared ingestion pipeline live; Strava refactored onto it
- **M2 · ~W9** — Garmin importing activities + wellness into the model
- **M3 · ~W10** — iOS HealthKit feeding the same pipeline
- **M4 · ~W14** — iOS app submitted to App Review

Why this order

Build the foundation once

Strava, Garmin, and iOS HealthKit are three sources of the same thing: completed sessions + wellness. Define the canonical sessions + wellness_daily schema, normalization, dedup, adherence mapping, and readiness score **first** — then each provider is a thin adapter, not a rebuild. This is why the foundation lane precedes both Garmin ingest and the HealthKit reader.

Ship the growth loop early & in parallel

The Strava activity-write branding and the result-cards share flow don't depend on approvals or the model — they're pure upside and they power the marketing strategy. Wire them into the web app in the first weeks; re-use the cards in the iOS share sheet when the app lands (W10–11). Growth compounds while the heavier lanes wait on Apple/Garmin.

Relative-week roadmap; approval durations are external and variable. Derived from *DuraveL_Garmin_Integration_Build_Plan.md* + *DuraveL_iOS_App_Build_Plan.md*. Shared-pipeline design common to both.
